Grounded system refers to a system where a conductor is grounded and is intended to or may carry current in the normal operation. The neutral on a wye system is a prime example of a grounded conductor. zThe grounding conductor system is not intended to carry operational current in its design.

PRINCIPLES OF ELECTRICAL GROUNDING - Pfeiffer Eng

In an electrical installation, an earthing system or grounding system connects specific parts of that installation with the Earth's conductive surface for safety and functional purposes. The point of reference is the Earth's conductive surface.

Design Of

Grounding

System grounding, or the intentional connection of a phase or neutral conductor to earth, is for the

purpose of controlling the voltage to earth, or ground, within predictable limits. It also provides for a flow of current that will allow detection of an unwanted connection between system conductors and ground [a ground fault].

These factors make the design of an earthing system complex, not derived from a simple calculation or the random driving of a few rods into the soil. Knowledge of the local soil conditions is mandatory and is the first step in the design process. This includes its moisture content, temperature, and resistivity under a given set of conditions.

Another thing many engineers worry about is HRG system maintenance. The neutral grounding resistor is the key. If the resistance of the neutral-to-ground path (where the NGR is

located) sinks below 75% of the desired value, the system tends toward being solidly grounded.
