Topological Insulators In 2d And

Topological insulators were first realized in 2D in system containing HgTe quantum wells sandwiched between cadmium telluride in 2007. The first 3D topological insulator to be realized experimentally was Bi 1 – x Sb x. Bismuth in its pure state, is a semimetal with a small electronic band gap.

The surface states of a strong topological insulator form a unique 2D topological metal [9,10] that is essentially half an ordinary metal. Unlike an ordinary metal, which has up and down spins at every point on the Fermi surface, the surface states are not spin degenerate.

Using first-principle calculations, we show that the hexagonal 2D BiB is a intriguing 2D topological insulators. In the absence of SOC, BiB is a topological metal with band inversion induced by crystal field along the direction normal to the 2D plane.

A conventional topological insulator in 2D and 3D supports gapless edge states and surface states, respectively, that are protected against local perturbations by the nontrivial topology of the...

If the overall Z2 sum of occupied bands is even, the system is a regular insulator, if the sum is odd, it is a topological insulator. For example the 2D system graphene possesses two Kramers pairs, has an even Z2 and thus is a 'trivial' system, whereas a material with one or three Kramers pairs would be a topological system.

Topological insulators are electronic materials that have a bulk band gap like an ordinary insulator, but have protected conducting states on their edge or surface. The 2D topological insulator is a quantum spin Hall insulator, which is a close cousin of the integer quantum Hall state.

A famous recent example is the theoretical prediction of crystalline materials known as topological insulators (TIs), several of which have now been identified in the laboratory [1]. TIs are electronic insulators in their d -dimensional interior (bulk) but allow metallic conduction on their (d – 1)-dimensional boundaries.

But topological matter attracted considerable interest from the physics community after the proposals for possible observation of symmetry-protected topological phases (or the so-called topological insulators) in graphene, and experimental observation of a 2D topological insulator in CdTe/HgTe/CdTe quantum wells in 2007.

In this dissertation, I investigate two representatives of Dirac materials - graphene and topological insulators. Specifically, I focus on the (i) effects of electron beam irradiation on graphene properties and (ii) electronic and thermal characteristics of exfoliated films of Bi2Te3-family of topological insulators.

These include the 3D topological insulators, which are largely made from narrow band-gap semiconductors with strong spin-orbit coupling [6]. In these materials, an electrically insulating interior coexists with surface states that form 2D metals on every free surface and have a similar locking of the electron’s spin perpendicular to its momentum.

How can electrons be “topological”? | Gravity and Levity

Topological insulators and quantum materials are gaining increasing interest across the physical, chemical and materials communities. Today, one can go to the Topological Materials Database and see whether a given bulk system is a Topological Insulators or Weyl Semimetal, but it remains unclear (at least to a moral like me) what steps could be taken to determine this from scratch.
