Weathering breaks down the Earth's surface into smaller pieces. Those pieces are moved in a process called erosion, and deposited somewhere else. Weathering can be caused by wind, water, ice, plants, gravity, and changes in temperature. To better understand how the erosion and weathering process works....

Weathering, Erosion, and Deposition Study Guide: I used to use a Study Guide to quickly introduce the important concepts. Then I discovered that a Cut-and-Paste FactSheet would work better. Quick FactSheets involve the whole body when students are required to cut out and place each "fact" in the correct place on the page. They interact to see ...

The outer curve of a meander experiences a greater water velocity which allows more weathering and erosion to occur (destructive forces). Explain the forces happening on the inside cuves of meanders. The inside curves on a meander cause the water velocity to decrease and therefore sediments are deposited (constructive force).

Soil Erosion and How to Prevent It helps young readers see the real impact of erosion on all life. This intriguing book describes the processes of weathering, erosion, and deposition, the impact of erosion on plants and animals, and kid-friendly steps to preventing erosion.

What Does Deposition Mean? Erosion, Weathering and ...

Weathering . The breaking down or disintegration of substances such as rocks and minerals by physical, chemical, or biological processes . Erosion . Deposition . When particles carried by water, ice, or wind are deposited (dropped) in another location . The movement of sediment or soil from one location to another by means of water, ice, or wind

Weathering, Erosion, or Deposition Sorting Activity

Erosion is the movement of the particles by ice, wind, or water. The particles are then transported by that agent until they are deposited to form sedimentary deposits, which can be later eroded again or transformed into sedimentary rocks. The weathering of the sediment grains continues during erosion and transportation.

Allochthonous karst bauxites result from two successive processes: (1) intense weathering and formation of a lateritic profile, involving the development of bauxitic and duricrust horizons; and (2) erosion of the lateritic profile and deposition above a carbonate unit located downstream.

The processes of weathering, erosion, and deposition are impacted by factors of the other systems such as water and wind. At the conclusion of the unit, students will be asked to make these connections to create a model of how systems interact. These may be some of the interactions that students choose.
