For well test analysis, the variation of pressure with time is usually expressed in graphical forms, that is, by a Cartesian plot of pressure vs time, semilog plot of pressure vs time, and log-log plot of pressure and its derivative vs time. Also, because the log-log plot can best reflect the flow characteristics, log-log plots are often used to represent well test analysis models in modern well test analysis.

Technicians should test a well pump's control box before pulling a nonworking pump from the well. When the water tank's pressure switch detects

low water pressure, its switch closes, which turns on the electricity to the control box. Once the water pressure reaches the switch's high-pressure limit the switch opens, turning off the electricity.

Procedure. The following SRT procedure is recommended to ensure meaningful test results. The test well should be shut-in long enough, but not less than 48 hours so that the BHP is near the shut-in formation pressure. The well may need to be backflowed if the shut-in pressure is above the expected fracture pressure.

Scope and definitions. There are many flavours of well tests and various ways to categorize test types by its objectives, however two main categories only by objectives, these are productivity tests and descriptive tests. According to The Lease Pumper's Handbook of Oklahoma Commission on Marginally Producing Oil and Gas Wells, there are four basic well test types: potential tests, daily ...

The production well testing is conducted to estimate the reservoir transmissibilities, the static reservoir fluid pressure inside the drainage area of a well, and the flowing well efficiency (Streltsova, 1988). Typically, the pressure drawdown and buildup tests are conducted on production wells.

The intent of the manual is for the auditor to become familiar with the activities of a well servicing company and to outline the taxability of these activities. Knowledge of the oil and gas industry is essential to understanding the material in this manual. The auditor should be familiar with the glossary at the end of the manual as well.

Test methods for dual completions. The injection permit will typically contain specific testing and monitoring requirements for the specific type of dual completion. If the permit application did not clearly state that the well was a dual completion, then a conventional permit would have been issued.

1) The casing should be tested prior to drilling out the shoe. 2) Drill out the shoe and cement, exposing 5 - 10 ft of new formation. 3) Circulate and condition the mud, check mud density in and out. 4) Pull the bit inside the casing. Line up cement pump and flush all lines to be used for the test. 5) Close BOPs.
